1c. VS Code (OPTIONAL)

Martin Alfaro

PhD in Economics

FEATURES AND KEYBOARD SHORTCUTS

We present a few keyboard shortcuts and handy features for <u>VS Code</u>. They also apply to its privacy-focused alternative <u>VS Codium</u>. Remarkably, these features are largely language-agnostic, holding regardless of the programming language you're working with.

For visual illustration, the features discussed are accompanied by GIFs. To view these GIFs, simply click "Example", or alternatively press Alt+1 or Alt+1 to open and close all of them simultaneously.

TO RUN A SCRIPT

Select the script to be executed and press Ctrl+Enter

▶ Example

TO FORMAT EXPRESSIONS AND MAKE THEM MORE LEGIBLE

Select the script to be formatted and press Ctrl+k + Ctrl+f. Sometimes, activating this tool requires running it twice.

▶ Example

TO ALIGN EQUAL SIGNS

This feature requires the VS Code Extension "Better Align". It aligns consecutive lines by using the equal sign and other symbols as a reference. It's implemented by pressing Alt + a.

▶ Example

See also the extension "Cursor Align", which aligns code by clicking the position on each line.

TO EXTEND THE CURSOR VERTICALLY

Hold down Alt+Ctrl + press 1 or 1

▶ Example

TO SEE THE DOCUMENTATION OF A FUNCTION

It requires hovering over the function.

▶ Example

Alternatively, you can go to the REPL, press ?, and then type the function's name you want to search for.

► Example

TO AUTOCOMPLETE A WORD

▶ Example

TO INTRODUCE UNICODE CHARACTERS (TAB COMPLETION)

Type a unicode character/command, press Ctrl + Space to open an option list, and then choose the option and press Tab.

▶ Example

In Julia, Greek letters and math have the same syntax as Latex. To add them, you need to start with $\[\]$ (e.g., $\[\]$ and use Tab completion.

TO SELECT THE SAME WORD MULTIPLE TIMES

Select the word and then press Ctrl+d for selecting each additional time it appears. This is useful when you want to change part of the expression.

► Example

TO HIDE PART OF THE SCRIPT

Given a code block, add **#region** at the beginning and **#endregion** at the end.

▶ Example

When you have several lines indented, VS Code allows you to hide the block automatically. The following example shows this for a function.

▶ Example

TO TURN MULTIPLE LINES INTO A COMMENT

Select all the lines you want to interpret as a comment rather than code. Then, press Ctrl + //.

▶ Example
